

Business Process as a Service & Software as a Service (Trusted Document Processing & Hosting Services for the Modern Enterprise)

Trusted Virtual Data Room (TVDR)

Overview

As an essential part of the Merger & Acquisition (M&A) process the data room is a repository to house the relevant information & data of the entity being acquired or sold for the purpose of allowing interested parties to conduct deal diligence.

In the modern business environment, physical & geographical boundaries are effectively removed by the network that connects us globally. A traditional data room, with its need for sequential & physical access, is no longer an efficient way for the modern business world.

Virtual Data Room (VDR)

A virtual data room functions exactly like a traditional data room with its ability to apply access control on its visitor but without the restriction of it being in a fixed geographical location. Access to a virtual data room is not restricted by time distance or the need to have sequential access.

It also has the added advantage of being able to mix digital data & physical data that has been converted to digital format. Amendments to the content of the room are also easily accomplished.

Our Solution

Trusted Hub is a premium VDR service provider in Asia. We focus on the following key areas, which are the pre-requisites for a successful VDR:

- Reliable & experienced processed in document data conversion, classification & online management.
- Controller of the transaction has full document rights control over the hosted documents.
- Comprehensive search capability that includes deploying Optical Character Recognition (OCR) technology on every page thus delivering a repository that is full text searchable.
- Audit trail for tracking & reporting of users' access pattern.
- Able to process & host the documents within a short time.
- Highly secured handling of confidential documents.

- Applying recommended taxonomy to classification of digital documents for easy online search & retrieval.
- Question & Answer module provides an easy way to allow room users to ask questions & room controllers to answer them.

Digital Rights Control & Security

Trusted Hub places extreme high importance on the security of the VDR. The VDR is equipped with multiple layers of security, to upkeep the confidentiality & integrity of electronic documents stored in the system.

Key security features include:

- Document access rights controls viewing, printing & saving.
- Deployment of 24 x 7 active & passive monitoring agents on our network infrastructure for irregular activities.
- Unique user session tracking
- Configurable time-out feature for increased security control.
- Communication channel is fully encrypted with channel protection mechanism such as 128-bit SSL.
- Multiple-tier firewall & defensive network infrastructure.

Trusted Hub Value Proposition

- Easy access for potential buyers all over the world as they are able to access the M&A documents online anywhere & anytime.
- Full audit trail functionality that allows for data mining of potential buyers usage profile.
- Images that are produced by Trusted Hub are Evidence Act certified & can therefore be used as backups for vital records.
- Unlike physical data room where only one user can access the documents one at a time, our VDR is able to support concurrent authorised access thus reducing cycle time for the M&A project.
